

FTS-Diffusion Replication: What Was Tested

Three separate evidence tracks: downstream predictive utility, real-asset pattern libraries, and Appendix B.3 simulated SISC.

S&P 500 Downstream

Author-style TATR/TMTR did not reproduce a stable SISC pattern. Continuous synthetic trajectories do reproduce a paper-like top, but that protocol differs from the released reference protocol.

GOOG / ZC=F SISC

Real-asset pattern libraries were generated for 100 real assets. Toy data assets and a timed sweep do not match the paper numbers. These outputs are visual and architectural checks, not B-B patterns.

Appendix B.3 SISC

Best B-B pattern, DTW is 0.0321 vs paper 0.01; best interval IoU is 0.6418 vs paper 0.784.

Current Conclusion

The released materials are not enough for an exact author-faithful replication.
The strongest evidence points to missing protocol/generation details rather than a single bad seed.
