

Original Claims vs Local Reproduction Evidence

Negative MAPE change means lower error. Local author-style endpoints are the closest available released-code/stored-matrix comparisons.

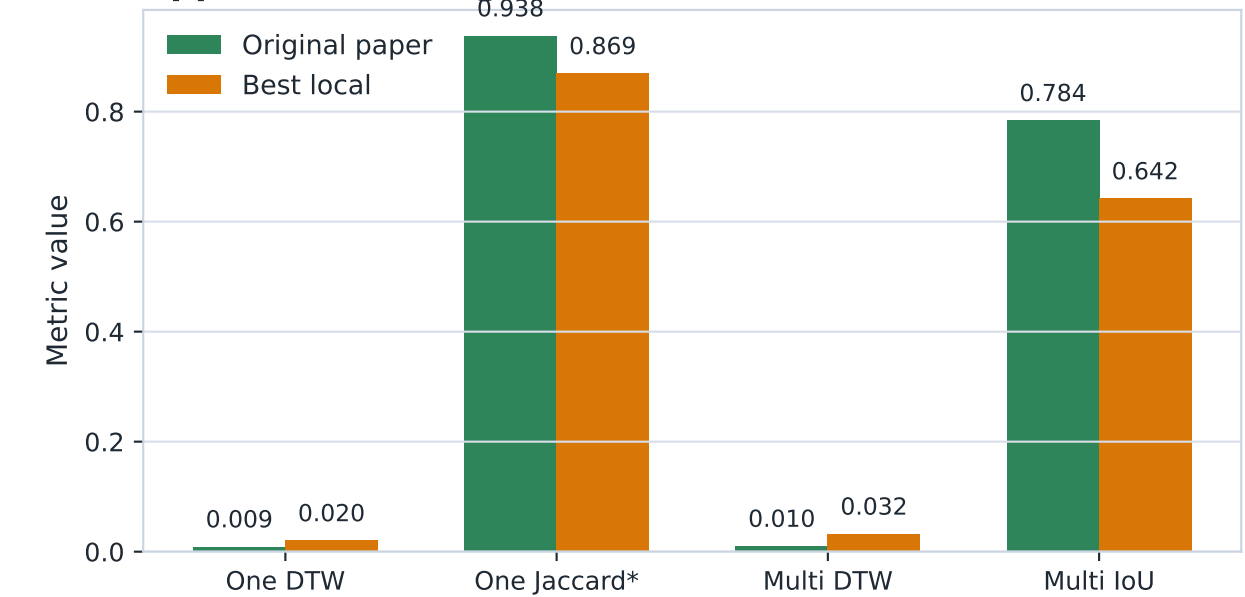

TATR Endpoints Do Not Match the Claimed Reductions

S&P Success Requires a Different Rollout

Appendix B.3 Targets Remain Out of Reach

Primary failure modes

1. TATR is under-specified: continuous pattern-evolution rollouts and independent reset blocks answer different experimental questions.
2. GOOG/ZC=F author-faithful TATR is not defined under the released S&P-style split because the held-out windows are too short.
3. Appendix B.3 lacks the exact toy generator, seed state, standard patterns, and metric implementation needed to recover the reported values.
